Supplementary Fig. 1. Representative case. After 6 weeks of aspirin administration, the CISS score decreased and radial peak velocity increased when compared with the baseline values. An increase in ICG perfusion rate from the baseline values was also observed. After a 2-week wash out period, triflusal was administered for another 6 weeks. As expected, the CISS score was further decreased and PSV and ICG perfusion rate were increased even further. CISS, cold intolerance symptom severity; ICG, indocyanine green; PSV, peak systolic velocity.
